Discover True Clinical Utility with the Industry’s Most Focused ELEMENTS TESTING
Patients who benefit from elements testing include those who:

- Present with health issues that could result from nutritional deficiencies or imbalances in essential elements
- Are exposed to heavy metals through hobbies, work or dentistry
- Live in older homes or areas where metals may be present in drinking water
- Have thyroid-related health issues
- Smoke

Essential elements, overall, are only healthy when they are within optimal ranges. Therefore, it’s important to know if essential or toxic elements are outside their optimal ranges.

Testing a panel like the Comprehensive Elements Profile offers the top four most toxic heavy metals and reveals levels of the nutritional elements iodine, selenium, zinc, copper and magnesium.

Environmental pollutants are all around us – in the air we breathe, in the water we drink, in the food we eat and in materials we touch.

These pollutants can significantly increase our risk of developing conditions like dementia, infertility, diabetes and cancer. They are also known to cause damage to the liver, kidneys and brain, as well as the cardiovascular, nervous and endocrine systems.

In excess, and when persistent, they can affect the synthesis and actions of hormones essential for managing our general health. One gland profoundly affected by pollutants is the thyroid.

Thyroid health can be undermined by nutritional deficiencies, particularly of iodine and selenium, or overexposure to bromine, arsenic, cadmium and mercury. It’s important to measure thyroid markers like TSH, fT3, fT4 and TPO, as well as these elements, when assessing the health of a patient whom you suspect has impaired thyroid function.

Our test:

**MOST FOCUSED**
Assess the four heavy metals considered most hazardous by the CDC, with a selection of nutritional elements that affect overall health.

**MOST CONVENIENT**
Discreet dried urine collection eliminates the hassle of jug urine collection & dried blood spot collection eliminates a trip to the phlebotomist.

**MOST MEANINGFUL REPORT**
ZRT’s test report includes levels and personalized comments that provide insight into a patient’s individual condition.

---

“Essential elements, are only healthy when they are within optimal ranges.”
Heavy Metals

Arsenic, mercury, cadmium and lead are the four most toxic heavy metals, according to the CDC. High levels lead to an increase in Reactive Oxygen Species (ROS) that damage proteins, lipids and DNA. They also form tight bonds with the essential element selenium, reducing its bioavailability for enzymes essential for thyroid hormone synthesis and activation.

Did you know?

Lead is readily taken up by red blood cells where it forms a tight complex with hemoglobin. Whole blood is used to monitor lead exposure because it reveals intracellular levels. Arsenic is rapidly cleared from the bloodstream after exposure, so it’s best to measure levels in urine.

Nutritional Elements

Iodine and selenium can be beneficial or toxic, depending on their levels. Deficiency or excess can cause thyroid dysfunction and goiter. Bromine is in the same chemical family as iodine and excessive amounts will compete with iodine in the thyroid – becoming particularly problematic when iodine levels are low and bromine is high. Copper and zinc are essential micronutrients needed in small quantities, and become toxic at higher levels.

Did you know?

ZRT uses whole blood to measure magnesium because it represents the intracellular magnesium level.
KEY DISTINCTIONS & CLINICAL UTILITY

MOST FOCUSED ASSESSMENT
Each test included in ZRT’s element panels has been selected for its value in providing clinical insight. The complete profile reveals exposure to the four heavy metals labeled most hazardous by the CDC, while the thyroid profile highlights the toxic and nutritional elements that play a critical role in thyroid function.

TESTING DONE RIGHT
Toxic and nutritional elements affect different systems of the body, so it makes sense that they can’t all be measured using the same method. ZRT tests using the most scientifically accurate method – either urine or whole blood – for our Elements profiles.

RESULTS WITH MEANING
ZRT is the only lab to offer customized comments on every report – correlating levels and symptoms to deliver real understanding. These comments highlight the role various elements play in health, and how deficiencies and excesses can lead to system dysfunction.
